

HEAD VENT SYSTEM

Part # 600-HVS-24W

The Head Vent System is a compact multiple head ventilation system that features a single plenum box which houses a powerful blower, four zone dampers and the control electronics. This system has been designed specifically for marine applications and is capable of servicing up to four separate heads at one time.

System Operation (Automatic)

If the system is set up for automatic operation (recommended) a motion sensor in each head will initiate the extraction of air in that head when it is occupied.

System Operation (Manual)

If automatic operation is not desired, switches may be used in place of the motion sensors and the occupant can simply turn the system on and off when it is needed.

Duct Work

The duct work for the Head Vent System may be constructed from standard four inch PVC pipe for best results.

Installation

The Head Vent System may be located in any convenient location on board the vessel including machinery spaces or lockers.

General Arrangement
